

Weather Tendency

Temperature

It's very early to say which weather we will have on Sabaudia between 2 and 6 June 2021 (blue rectangle in the figure below). Forecasts over 10 days have very low reliability.

However, we can see that after 26 May, we will have a continuous increase of Tmax that (in Rome) could pass the 30°C in the early afternoon (red arrow). Since Sabaudia is a coast town, see breeze will limit the temperature maximum during the day.

As we are yet in Spring time (till 21 June summer solstice), the temperature range (Tmax - Tmin) could be very high during the day, reaching more than 14-16°C in this period, with a rapid temperature increase during the early morning (e.g. yellow points).
